09 Application Screenshots

Item	Details
Course	DBMS Project — Semester 5
Team	Sneha Angelin Jisho (PES2UG24CS507); Sowmya Ramesh (PES2UG24CS512)
Stack	React + Vite; Node.js + Express; MySQL; MongoDB
Repository	https://github.com/snehajisho/Satellite_Data_Provenance_Earth_Observatory-DBMS_Project

Application Screenshots

The following screenshots show the implemented application interfaces, including satellite browsing and editing, observation filtering, analytics, and quality inspection.

Figure 1. Application Home Page

Landing page of the Earth Observatory application, with navigation to the main modules and a location search entry point.

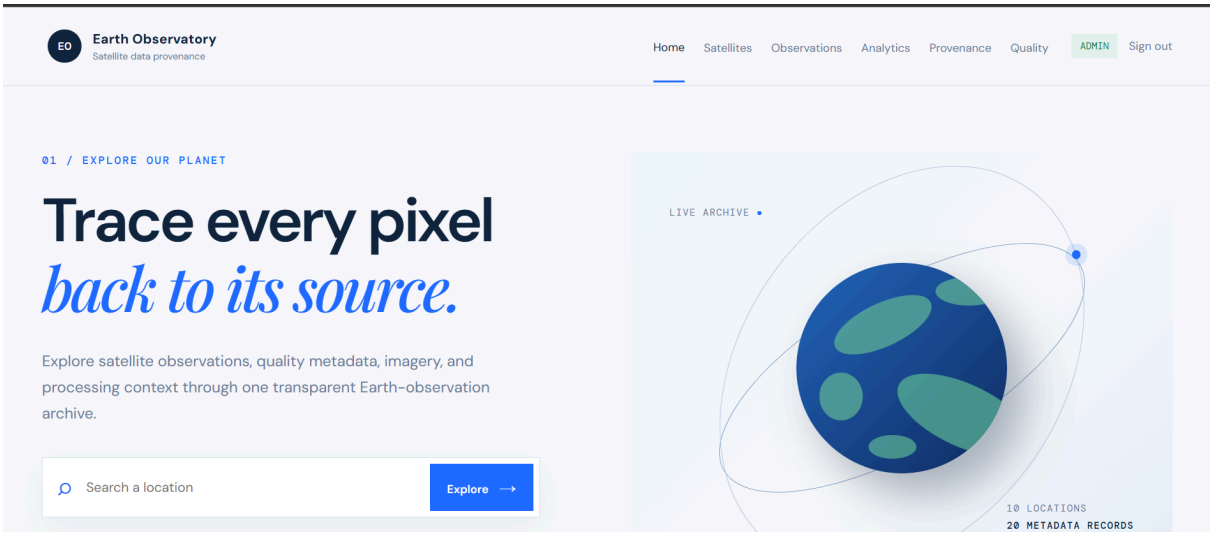

Figure 2. Satellite Explorer

Satellite explorer displaying the available satellites, selected satellite details, orbit information, status, and associated observations.

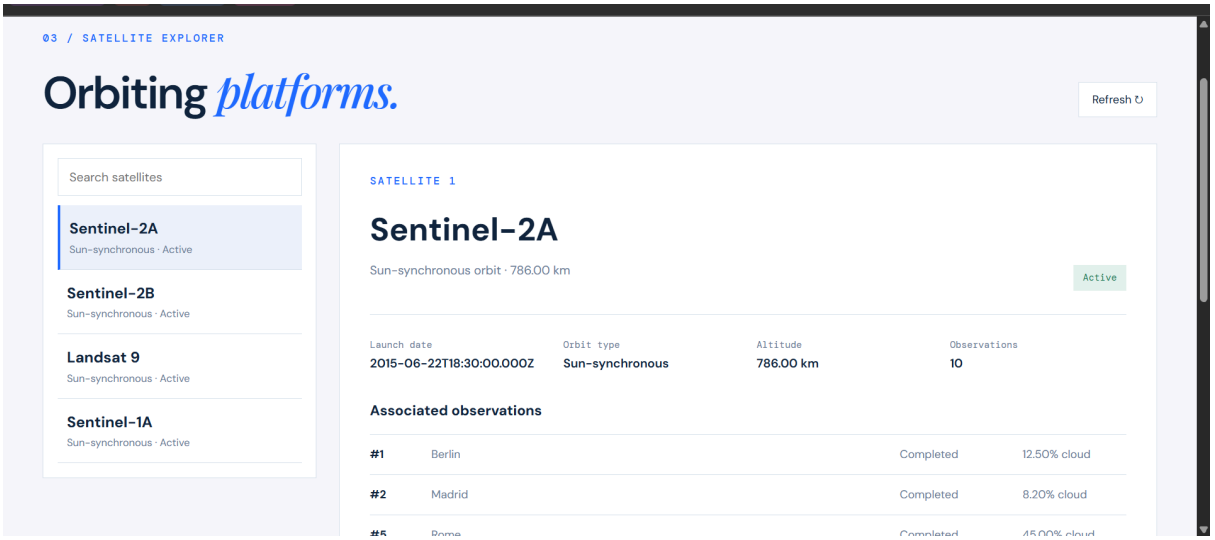

Figure 3. Edit Satellite Form

Form for editing a satellite's details, including its name, launch date, orbit type, altitude, and status.

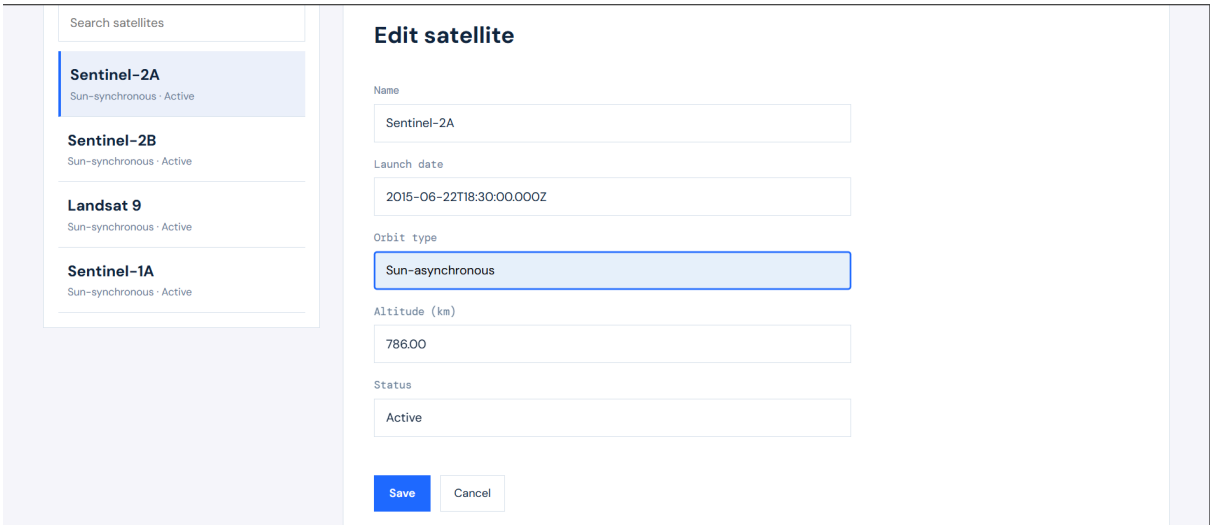

Figure 4. Satellite Details and Associated Observations

Satellite details view showing the selected satellite and its associated observation records.

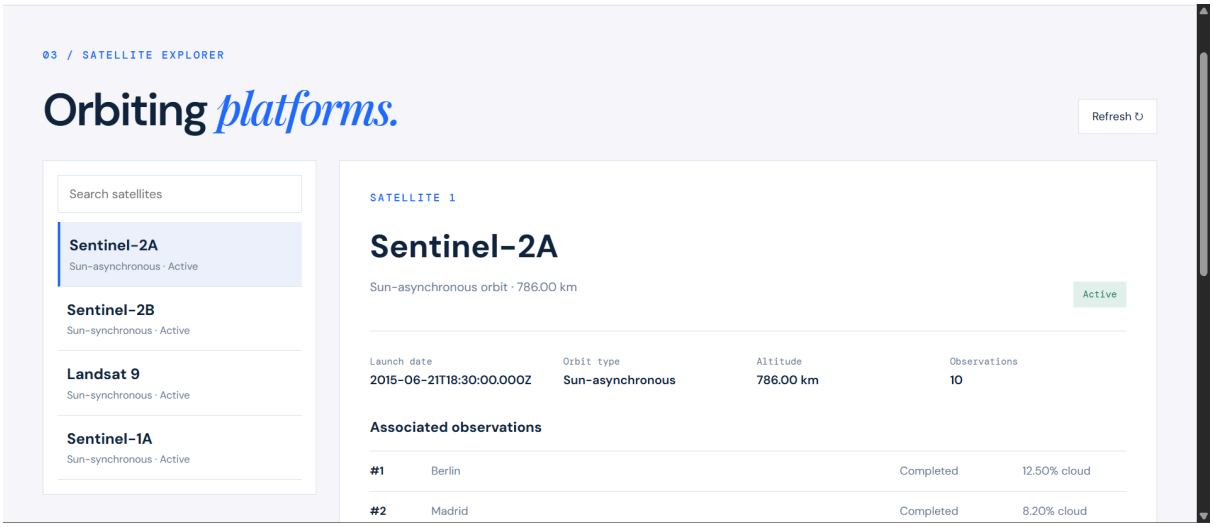

Figure 5. Observation Management and Filtering

Observations page with filters for observation ID, location, satellite, status, and cloud cover, along with the observation records table.

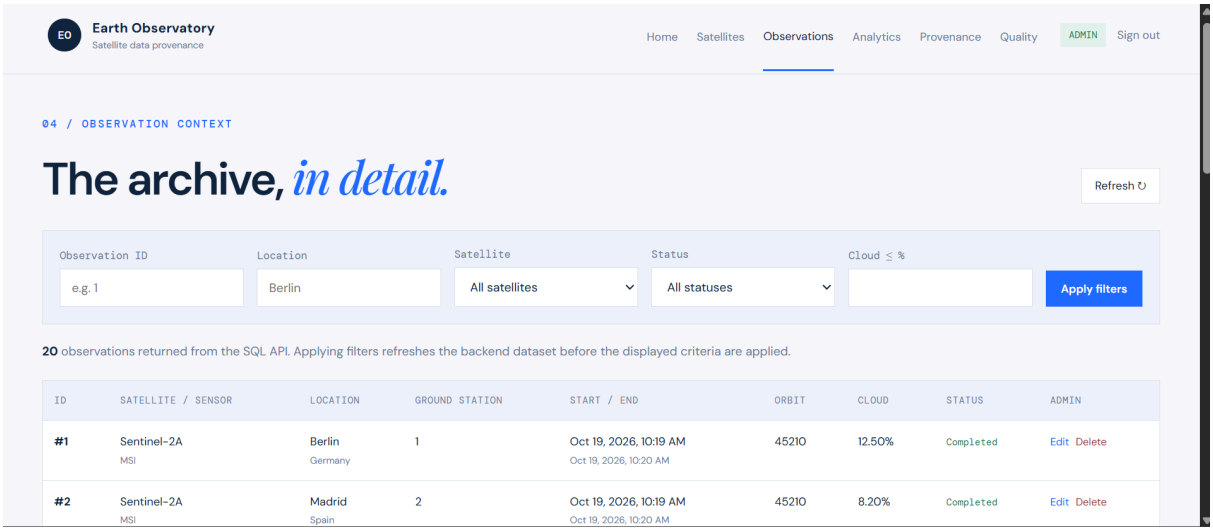

Figure 6. Analytics Dashboard

Dashboard presenting repository statistics and visual summaries, including observation counts by status, average cloud cover by geographic area, processing levels, and areas with observations.

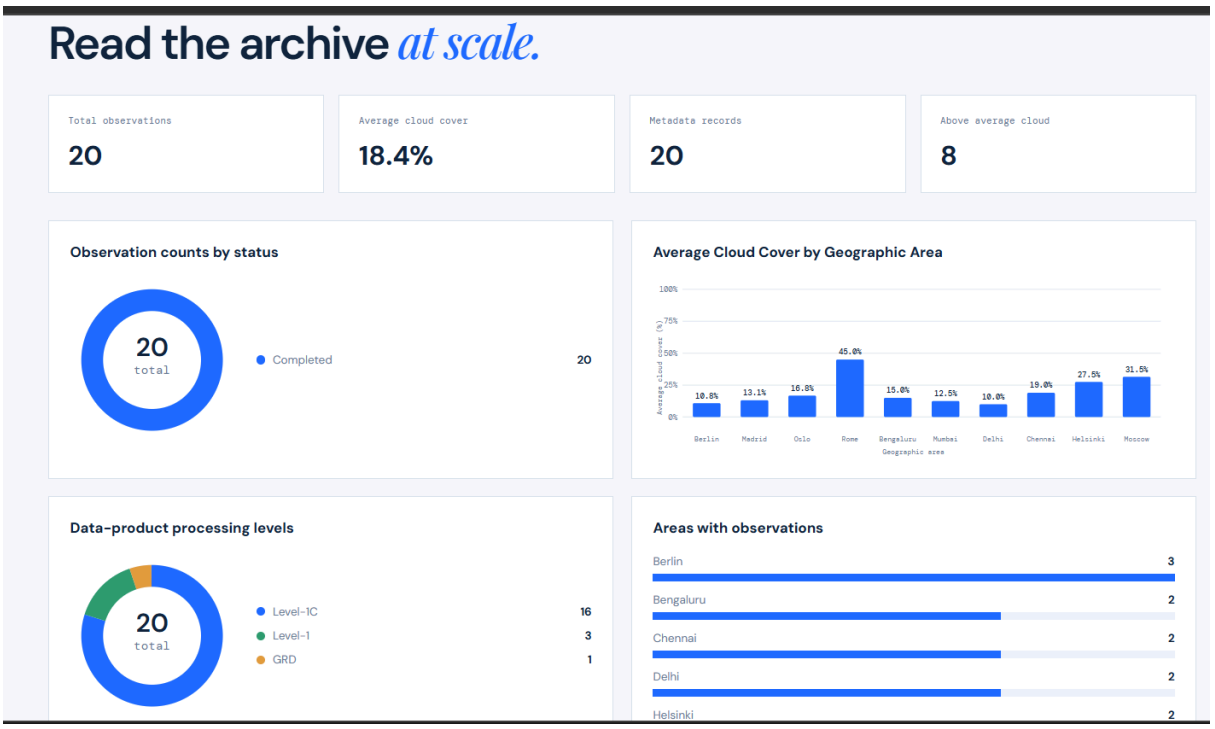

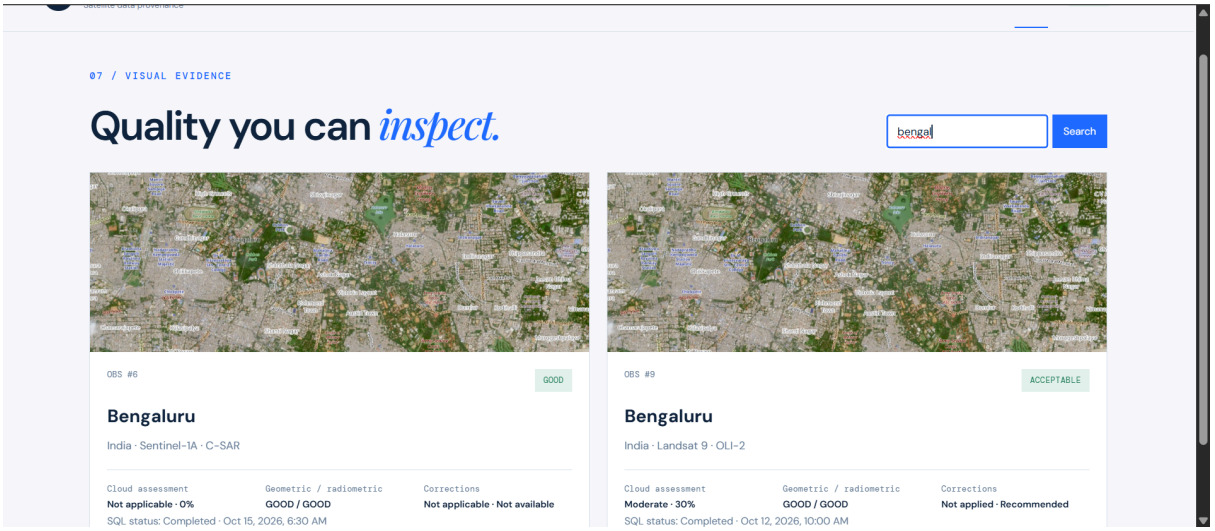

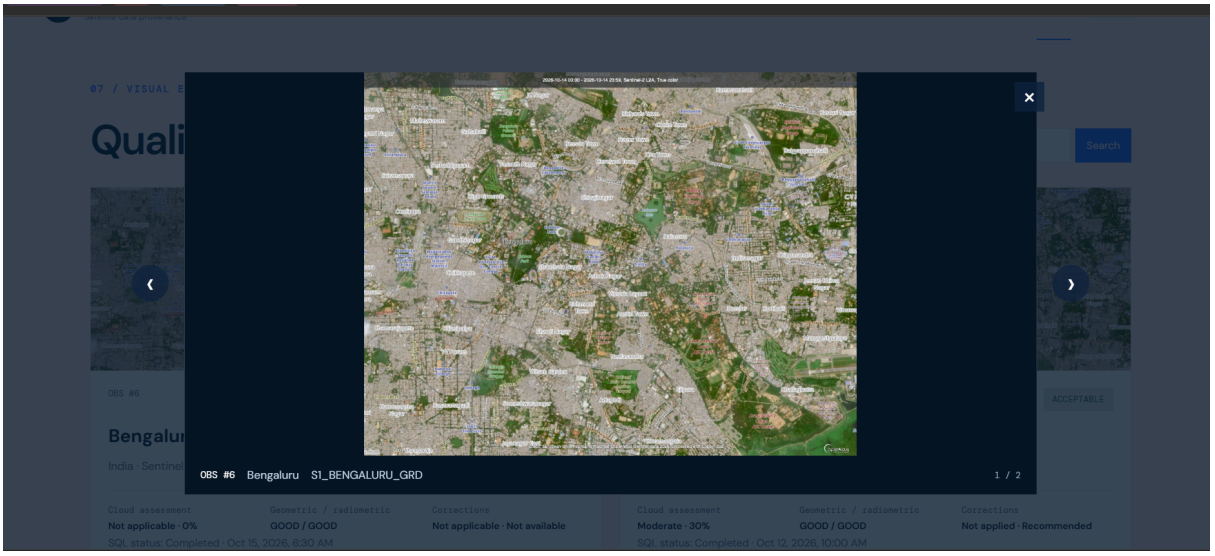

Figure 7. Quality Inspection and Visual Evidence

Quality page showing satellite imagery records for a searched location, with quality indicators and metadata such as resolution, acquisition date, and correction status.
